It's easy to use the AHT20 sensor with CircuitPython and the [Adafruit CircuitPython AHT20](#) module. This module allows you to easily write Python code that reads the temperature and humidity from the sensor.

You can use this sensor with any CircuitPython microcontroller board or with a computer that has GPIO and Python [thanks to Adafruit_Blinka, our CircuitPython-for-Python compatibility library](#).

CircuitPython Microcontroller Wiring

First wire up a AHT20 to your board exactly as follows. Here is an example of the AHT20 wired to a Feather using I2C:

-
- **Board 3V to sensor VIN**
- **Board GND to sensor GND**
- **Board SCL to sensor SCL**
- **Board SDA to sensor SDA**

Python Computer Wiring

Since there's *dozens* of Linux computers/boards you can use we will show wiring for Raspberry Pi. For other platforms, [please visit the guide for CircuitPython on Linux to see whether your platform is supported.](#)

Here's the Raspberry Pi wired with I2C:

- **Pi 3V3 to sensor VIN**
- **Pi GND to sensor GND**
- **Pi SCL to sensor SCL**
- **Pi SDA to sensor SDA**

CircuitPython Installation of AHT20 Library

You'll need to install the [Adafruit CircuitPython AHT20](#) library on your CircuitPython board.

First make sure you are running the [latest version of Adafruit CircuitPython](#) for your board.

Next you'll need to install the necessary libraries to use the hardware--carefully follow the steps to find and install these libraries from [Adafruit's CircuitPython library bundle](#). Our CircuitPython starter guide has [a great page on how to install the library bundle](#).

Copy the following files from the bundle to the **lib** folder on your **CIRCUITPY** drive:

- **adafruit_ahtx0.mpy**
- **adafruit_bus_device**

Before continuing make sure your board's **lib** folder or root filesystem has the **adafruit_ahtx0.mpy**, and **adafruit_bus_device** file and folder copied over.

Next [connect to the board's serial REPL](#), so you are at the CircuitPython >>> prompt.

Python Installation of AHT20 Library

You'll need to install the **Adafruit_Blinka** library that provides the CircuitPython support in Python. This may also require enabling I2C on your platform and verifying you are running Python 3. [Since each platform is a little different, and Linux changes often, please visit the CircuitPython on Linux guide to get your computer ready!](#)

Once that's done, from your command line run the following command:

- `sudo pip3 install adafruit-circuitpython-ahtx0`

If your default Python is version 3 you may need to run 'pip' instead. Just make sure you aren't trying to use CircuitPython on Python 2.x, it isn't supported!

CircuitPython & Python Usage

To demonstrate the usage of the sensor we'll initialize it and read the temperature and humidity from the board's Python REPL.

Run the following code to import the necessary modules and initialize the I2C connection with the sensor:

[Download File](#)
[Copy Code](#)

```
import board
import adafruit_ahtx0

sensor = adafruit_ahtx0.AHTx0(board.I2C())
```

Now you're ready to read values from the sensor using these properties:

- **temperature** - The temperature in Celsius.
- **relative_humidity** - The relative humidity in percent.

For example to print temperature and relative humidity values:

[Download File](#)
[Copy Code](#)

```
print("\nTemperature: %0.1f C" % sensor.temperature)
print("Humidity: %0.1f %" % sensor.relative_humidity)
```

That's all there is to using the AHT20 sensor with CircuitPython!

Full Example Code

[Download Project Bundle](#)
[Copy Code](#)

```
# SPDX-FileCopyrightText: 2021 ladyada for Adafruit Industries
# SPDX-License-Identifier: MIT

"""
Basic `AHTx0` example test
"""

import time
import board
import adafruit_ahtx0

# Create sensor object, communicating over the board's default I2C bus
i2c = board.I2C() # uses board.SCL and board.SDA
# i2c = board.STEMMA_I2C() # For using the built-in STEMMMA QT connector on a microcontroller
sensor = adafruit_ahtx0.AHTx0(i2c)

while True:
```

```
print("\nTemperature: %0.1f C" % sensor.temperature)
print("Humidity: %0.1f %" % sensor.relative_humidity)
time.sleep(2)
```
